

习题2-1 (A) 1. 用定义求下列函数的导数.

(4) $f(x) = x|x|$, 求 $f'(0)$.

证

$$\begin{aligned} f'(0) &= \lim_{\Delta x \rightarrow 0} \frac{f(0 + \Delta x) - f(0)}{\Delta x} \\ &= \lim_{\Delta x \rightarrow 0} \frac{\Delta x |\Delta x| - 0}{\Delta x} \\ &= \lim_{\Delta x \rightarrow 0} |\Delta x| = 0. \end{aligned}$$

习题2-1 (A) 2. 已知函数 f 在 x_0 处可导, 求下列极限.

$$(1) \lim_{\Delta x \rightarrow 0} \frac{f(x - \Delta x) - f(x)}{\Delta x}.$$

证

$$\begin{aligned} \lim_{\Delta x \rightarrow 0} \frac{f(x - \Delta x) - f(x)}{\Delta x} &= - \lim_{\Delta x \rightarrow 0} \frac{f(x - \Delta x) - f(x)}{-\Delta x} \\ &= - \lim_{t \rightarrow 0} \frac{f(x + t) - f(x)}{t} \quad (\text{令 } t = -\Delta x) \\ &= -f'(x). \end{aligned}$$

习题2-1 (A) 2. 已知函数 f 在 x_0 处可导, 求下列极限.

$$(4) \lim_{x \rightarrow x_0} \frac{x_0 f(x) - x f(x_0)}{x - x_0}.$$

证

$$\begin{aligned} & \lim_{x \rightarrow x_0} \frac{x_0 f(x) - x f(x_0)}{x - x_0} \\ &= \lim_{x \rightarrow x_0} \frac{x_0 f(x) - x_0 f(x_0) + x_0 f(x_0) - x f(x_0)}{x - x_0} \\ &= \lim_{x \rightarrow x_0} \left[x_0 \frac{f(x) - f(x_0)}{x - x_0} + f(x_0) \right] \\ &= x_0 f'(x_0) + f(x_0). \end{aligned}$$

习题2-1(A) 7 设 $f(x)$ 是偶函数, 且 $f'(0)$ 存在, 求证:
 $f'(0) = 0$.

证 如果 $f(x)$ 是偶函数, 则

$$f(-x) = f(x),$$

所以

$$\begin{aligned} f'(0) &= \lim_{h \rightarrow 0} \frac{f(h) - f(0)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(-h) - f(0)}{h} \\ &= - \lim_{h \rightarrow 0} \frac{f(-h) - f(0)}{-h} = -f'(0). \end{aligned}$$

则 $f'(0) = 0$.

习题2-1(A) 8 已知 $g(x) = |x - a|\varphi(x)$, $\varphi(x)$ 在 $x = a$ 连续, 讨论 $g(x)$ 在 $x = a$ 处的可导性.

解 根据导数的定义, 要判断下面极限

$$\lim_{x \rightarrow a} \frac{g(x) - g(a)}{x - a} = \lim_{x \rightarrow a} \frac{|x - a|\varphi(x)}{x - a}$$

的存在性.

因为

$$\begin{aligned} \lim_{x \rightarrow a^+} \frac{|x - a|\varphi(x)}{x - a} &= \lim_{x \rightarrow a^+} \frac{(x - a)\varphi(x)}{x - a} \\ &= \lim_{x \rightarrow a^+} \varphi(x) = \varphi(a), \\ \lim_{x \rightarrow a^-} \frac{|x - a|\varphi(x)}{x - a} &= \lim_{x \rightarrow a^-} \frac{-(x - a)\varphi(x)}{x - a} \\ &= \lim_{x \rightarrow a^-} -\varphi(x) = -\varphi(a), \end{aligned}$$

所以, 当 $\varphi(a) = -\varphi(a)$, 即 $\varphi(a) = 0$ 时, $g'(a)$ 存在, 且 $g'(a) = 0$.

习题2-1(A) 11 试确定 a, b 的值, 使得函数

$$f(x) = \begin{cases} x^2, & x \leq 1, \\ ax + b, & x > 1, \end{cases}$$

在 $x = 1$ 处的连续且可导.

解 因为

$$\lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} (ax + b) = a + b,$$

$$\lim_{x \rightarrow 1^-} f(x) = \lim_{x \rightarrow 1^-} x^2 = 1,$$

所以当 $a + b = 1$ 时, 有 $\lim_{x \rightarrow 1} f(x) = 1 = f(1)$, 函数在 $x = 1$ 处连续.

当 $a + b = 1$ 时,

$$\begin{aligned} f'_+(0) &= \lim_{\Delta x \rightarrow 0^+} \frac{f(1 + \Delta x) - f(1)}{\Delta x} \\ &= \lim_{\Delta x \rightarrow 0^+} \frac{(a(1 + \Delta x) + b) - 1}{\Delta x} = a, \end{aligned}$$

$$\begin{aligned} f'_-(0) &= \lim_{\Delta x \rightarrow 0^-} \frac{f(1 + \Delta x) - f(1)}{\Delta x} \\ &= \lim_{\Delta x \rightarrow 0^-} \frac{(1 + \Delta x)^2 - 1}{\Delta x} = 2, \end{aligned}$$

所以当 $a = 2$ 时, $f'(0)$ 存在.

因此, 当 $b = -1$ 且 $a = 2$ 时, 函数在 $x = 1$ 处可导.

习题2-1(A) 18 设 $f(0) = 0, f'(0) = 2$, 求 $\lim_{x \rightarrow 0} \frac{f(x)}{\sin 2x}$.
解 因为 $\sin 2x \sim 2x (x \rightarrow 0)$, 则

$$\begin{aligned} \lim_{x \rightarrow 0} \frac{f(x)}{\sin 2x} &= \lim_{x \rightarrow 0} \frac{f(x)}{2x} \\ &= \frac{1}{2} \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x - 0} = \frac{1}{2} f'(0) = 1. \end{aligned}$$

习题2-1(B) 1 如果 $f(x)$ 在 $x = 0$ 连续, 且 $\lim_{x \rightarrow 0} \frac{f(x)}{x}$ 存在, 证明: $f(x)$ 在 $x = 0$ 处可导.

解 记 $\lim_{x \rightarrow 0} \frac{f(x)}{x} = A$, 因为

$$\begin{aligned} f(0) &= \lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} \left(\frac{f(x)}{x} \cdot x \right) \\ &= \lim_{x \rightarrow 0} \frac{f(x)}{x} \cdot \lim_{x \rightarrow 0} x = A \cdot 0 = 0, \end{aligned}$$

于是

$$f'(0) = \lim_{x \rightarrow 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0} \frac{f(x)}{x} = A.$$

习题2-1(B) 2 设 $f(x)$ 定义在 $(-\infty, +\infty)$ 上的函数,
 $f(x) \neq 0$, $f'(0) = 1$, 且

$$f(x+y) = f(x)f(y), \forall x, y \in (-\infty, +\infty),$$

求证: $f(x)$ 在 $(-\infty, +\infty)$ 上可导, 且 $f'(x) = f(x)$.

解 取 $x = 1, y = 0$, 则

$$f(1+0) = f(1)f(0) \Rightarrow f(1) = f(1)f(0),$$

因为 $f(x) \neq 0$, 于是 $f(0) = 1$.

所以

$$\begin{aligned} f'(x) &= \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{f(x)f(\Delta x) - f(x)}{\Delta x} \\ &= f(x) \lim_{\Delta x \rightarrow 0} \frac{f(\Delta x) - 1}{\Delta x} = f(x) \lim_{\Delta x \rightarrow 0} \frac{f(\Delta x) - f(0)}{\Delta x} \\ &= f(x)f'(0) = f(x). \end{aligned}$$

习题2-1(B) 3 如果函数 $f(x)$ 在点 a 处可导, 且 $f(a) \neq 0$,

$$\text{求 } \lim_{n \rightarrow \infty} \left[\frac{f\left(a + \frac{1}{n}\right)}{f(a)} \right]^n.$$

证 令 $y = \left[\frac{f\left(a + \frac{1}{n}\right)}{f(a)} \right]^n$, 则

$$\ln y = \frac{\left[\ln f\left(a + \frac{1}{n}\right) - \ln f(a) \right]}{\frac{1}{n}},$$

于是

$$\begin{aligned}\lim_{n \rightarrow \infty} \ln y &= \lim_{n \rightarrow \infty} \frac{\left[\ln f \left(a + \frac{1}{n} \right) - \ln f(a) \right]}{\frac{1}{n}} \\&= \lim_{x \rightarrow 0} \frac{[\ln f(a+x) - \ln f(a)]}{x} \\&= [\ln f(x)]' \Big|_{x=a} = \frac{1}{f(x)} \cdot f'(x) \Big|_{x=a} = \frac{f'(a)}{f(a)}.\end{aligned}$$

所以

$$\lim_{n \rightarrow \infty} \left[\frac{f \left(a + \frac{1}{n} \right)}{f(a)} \right]^n = e^{\frac{f'(a)}{f(a)}}$$

习题2-1(B) 3 设曲线 $y = f(x)$ 在原点与 $y = \sin x$ 相切,

求极限 $\lim_{n \rightarrow \infty} n^{\frac{1}{2}} \sqrt{f\left(\frac{2}{n}\right)}$.

证 因为

$$y(0) = 0, y'(0) = (\sin x)'|_{x=0} = 1,$$

又因为曲线 $y = f(x)$ 在原点与 $y = \sin x$ 相切, 故

$$f(0) = y(0) = 0, f'(0) = y'(0) = 1.$$

于是

$$\begin{aligned} \lim_{n \rightarrow \infty} n^{\frac{1}{2}} \sqrt{f\left(\frac{2}{n}\right)} &= \lim_{n \rightarrow \infty} 2^{\frac{1}{2}} \sqrt{\frac{f\left(\frac{2}{n}\right) - f(0)}{\frac{2}{n}}} \\ &= \sqrt{2} \sqrt{f'(0)} = \sqrt{2}. \end{aligned}$$

习题2-1(B) 5 设 $n \in N_+$, 讨论函数

$$f(x) = \begin{cases} x^n \sin \frac{1}{x}, & x \neq 0, \\ 0, & x = 0, \end{cases}$$

在 $x = 0$ 处的连续性和可导性, 以及 $f'(x)$ 在 $x = 0$ 处的连续性.

解 (1) 因为 $n > 0$ 时, 所以

$$\lim_{x \rightarrow 0} x^n = 0, \left| \sin \frac{1}{x} \right| \leq 1,$$

所以

$$\lim_{x \rightarrow 0} f(x) = \lim_{x \rightarrow 0} x^n \sin \frac{1}{x} = 0 = f(0),$$

此时, $f(x)$ 在 $x = 0$ 点连续.

(2) 当 $n \geq 2$ 时, 有

$$f'(0) = \lim_{x \rightarrow 0} \frac{x^n \sin \frac{1}{x} - f(0)}{x - 0} = \lim_{x \rightarrow 0} x^{n-1} \sin \frac{1}{x} = 0,$$

而当 $n = 1$ 时, 上式极限不存在, 故此时 $f'(0)$ 不存在. 又当 $x \neq 0$ 时, 有

$$\begin{aligned} f'(x) &= \left(x^n \sin \frac{1}{x} \right)' = nx^{n-1} \sin \frac{1}{x} + x^n \cos \frac{1}{x} \left(-\frac{1}{x^2} \right) \\ &= nx^{n-1} \sin \frac{1}{x} - x^{n-2} \cos \frac{1}{x}. \end{aligned}$$

所以

$$f'(x) = \begin{cases} nx^{n-1} \sin \frac{1}{x} - x^{n-2} \cos \frac{1}{x}, & x \neq 0, \\ 0, & x = 0, \end{cases}$$

(3) 当 $n \geq 3$ 时, 有

$$\lim_{x \rightarrow 0} x^{n-1} = 0, \lim_{x \rightarrow 0} x^{n-2} = 0,$$

$$\left| \sin \frac{1}{x} \right| \leq 1, \left| \cos \frac{1}{x} \right| \leq 1,$$

所以

$$\begin{aligned} \lim_{x \rightarrow 0} f'(x) &= \lim_{x \rightarrow 0} \left(nx^{n-1} \sin \frac{1}{x} - x^{n-2} \cos \frac{1}{x} \right) \\ &= 0 = f'(0). \end{aligned}$$

故此时 $f'(x)$ 在 $x = 0$ 点连续.

但是, 当 $n = 2$ 时, 由于 $\lim_{x \rightarrow 0} nx^{n-1} \sin \frac{1}{x} = 0$,

而 $\lim_{x \rightarrow 0} x^{n-2} \cos \frac{1}{x}$ 不存在, 所以 $\lim_{x \rightarrow 0} f'(x)$ 不存在, 故此
时 $f'(x)$ 在 $x = 0$ 点不连续.

习题2-1(B) 6 设 $f(x) \in C[a, b]$, $f(a) = f(b) = 0$, 且 $f'_+(a) \cdot f'_-(b) > 0$, 求证: $\exists \xi \in (a, b)$, 使得 $f(\xi) = 0$.

解 设 $f'_+(a) > 0$, $f'_-(b) > 0$.

根据

$$\lim_{x \rightarrow a^+} \frac{f(x) - f(a)}{x - a} = \lim_{x \rightarrow a^+} \frac{f(x)}{x - a} = f'_+(a) > 0$$

则 $\exists x_1 \in (a, a + \delta_1)$ 使得: $\frac{f(x_1)}{x_1 - a} > 0, \Rightarrow f(x_1) > 0$.

根据

$$\lim_{x \rightarrow b^-} \frac{f(x) - f(b)}{x - b} = \lim_{x \rightarrow b^-} \frac{f(x)}{x - b} = f'_-(b) > 0$$

则 $\exists x_2 \in (b - \delta_2, b)$ 使得: $\frac{f(x_2)}{x_2 - b} > 0, \Rightarrow f(x_2) < 0$.

所以, $\exists \xi \in (a, b)$, 使得 $f(\xi) = 0$.

习题2-2(A) 3 求下列函数的导数.

(14) $y = x + x^x + x^{x^x}$.

解 因为

$$\begin{aligned}(x^x)' &= (e^{x \ln x})' = e^{x \ln x} (x \ln x)' \\&= e^{x \ln x} (x(\ln x)' + (x)' \ln x) = x^x (1 + \ln x), \\(x^{x^x})' &= (e^{x^x \ln x})' = e^{x^x \ln x} (x^x \ln x)' \\&= e^{x^x \ln x} (x^x (\ln x)' + (x^x)' \ln x) \\&= e^{x^x \ln x} \left(x^x \frac{1}{x} + x^x (1 + \ln x) \ln x, \right) \\&= x^{x^x} \cdot x^x \cdot \left[\frac{1}{x} + (1 + \ln x) \ln x \right],\end{aligned}$$

则

$$\begin{aligned}y' &= (x + x^x + x^{x^x})' \\&= 1 + (x^x)' + (x^{x^x})' = \dots\end{aligned}$$

习题2-2(A) 3 求下列函数的导数.

$$(19) y = \sqrt[3]{\frac{1 - \sin 2x}{1 + \sin 2x}}.$$

解 因为

$$\ln y = \frac{1}{3} [\ln(1 - \sin 2x) - \ln(1 + \sin 2x)],$$

则两边求导, 得

$$\frac{y'}{y} = \frac{1}{3} \left[\frac{-2 \cos 2x}{1 - \sin 2x} - \frac{2 \cos 2x}{1 + \sin 2x} \right],$$

所以

$$y' = \frac{1}{3} \sqrt[3]{\frac{1 - \sin 2x}{1 + \sin 2x}} \left[\frac{-2 \cos 2x}{1 - \sin 2x} - \frac{2 \cos 2x}{1 + \sin 2x} \right],$$

习题2-2(A) 4 已知 $y = f\left(\frac{3x-2}{3x+2}\right)$,

$f'(x) = \arctan x^2$, 求 $\frac{dy}{dx}\bigg|_{x=0}$.

解 因为

$$\begin{aligned}\frac{dy}{dx} &= \left(f\left(\frac{3x-2}{3x+2}\right)\right)' = f'\left(\frac{3x-2}{3x+2}\right) \cdot \left(\frac{3x-2}{3x+2}\right)' \\ &= \arctan\left(\frac{3x-2}{3x+2}\right)^2 \cdot \frac{12}{(3x+2)^2},\end{aligned}$$

得

$$\frac{dy}{dx}\bigg|_{x=0} = \frac{3\pi}{4}.$$

习题2-2(A) 4 已知 $y = f\left(\frac{3x-2}{3x+2}\right)$,

$f'(x) = \arctan x^2$, 求 $\frac{dy}{dx}\bigg|_{x=0}$.

解 因为

$$\begin{aligned}\frac{dy}{dx} &= \left(f\left(\frac{3x-2}{3x+2}\right)\right)' = f'\left(\frac{3x-2}{3x+2}\right) \cdot \left(\frac{3x-2}{3x+2}\right)' \\ &= \arctan\left(\frac{3x-2}{3x+2}\right)^2 \cdot \frac{12}{(3x+2)^2},\end{aligned}$$

得

$$\frac{dy}{dx}\bigg|_{x=0} = \frac{3\pi}{4}.$$

习题2-2(A) 6 求下列函数的导数.

$$(6) f(x) = \begin{cases} \frac{x}{1 + e^{\frac{1}{x}}}, & x \neq 0, \\ 0, & x = 0, \end{cases}.$$

解 在 $x = 0$ 处, 有

$$\lim_{x \rightarrow 0^+} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^+} \frac{\frac{x}{1 + e^{\frac{1}{x}}} - 0}{x - 0} = \lim_{x \rightarrow 0^+} \frac{1}{1 + e^{\frac{1}{x}}} = 0,$$

$$\lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^-} \frac{\frac{x}{1 + e^{\frac{1}{x}}} - 0}{x - 0} = \lim_{x \rightarrow 0^-} \frac{1}{1 + e^{\frac{1}{x}}} = 1,$$

故 $f'(0)$ 不存在.

在 $x \neq 0$ 处, 有

$$f'(x) = \left(\frac{x}{1 + e^{\frac{1}{x}}} \right)' = \frac{1 + \left(1 + \frac{1}{x}\right) e^{\frac{1}{x}}}{(1 + e^{\frac{1}{x}})^2}.$$

$$\text{所以, } f'(x) = \begin{cases} \frac{1 + \left(1 + \frac{1}{x}\right) e^{\frac{1}{x}}}{(1 + e^{\frac{1}{x}})^2}, & x \neq 0, \\ \text{导数不存在,} & x = 0, \end{cases}.$$

习题2-2(A) 9 求下列函数的导数.

(3) $f(x) = x^2 \sin 2x$, 求 $f^{(n)}(x)$.

解 取 $u = \sin 2x$, $v = x^2$, 则

$$u^{(n)} = 2^n \sin \left(2x + \frac{n\pi}{2} \right),$$

$$v' = 2x, v'' = 2, v^{(n)} = 0 \quad (n \geq 3).$$

由莱布尼兹公式, 得

$$\begin{aligned} f^{(n)}(x) &= u^{(n)}v^{(0)} + nu^{(n-1)}v' + \frac{n(n-1)}{2!}u^{(n-2)}v'' + \dots \\ &= 2^n \sin \left(2x + \frac{n\pi}{2} \right) \cdot x^2 + n2^{n-1} \sin \left(2x + \frac{(n-1)\pi}{2} \right) \cdot 2x \\ &\quad + \frac{n(n-1)}{2!} 2^{n-2} \sin \left(2x + \frac{(n-2)\pi}{2} \right) \cdot 2. \end{aligned}$$

习题2-2(A) 9 求下列函数的导数.

(6) $f(x) = \frac{1}{x^2 - 3x + 2}$, 求 $f^{(n)}(x)$.

解 因为

$$f(x) = \frac{1}{x^2 - 3x + 2} = \frac{1}{x - 2} - \frac{1}{x - 1},$$

所以

$$\begin{aligned} f^{(n)}(x) &= \left(\frac{1}{x - 2} \right)^{(n)} - \left(\frac{1}{x - 1} \right)^{(n)} \\ &= \frac{(-1)^n n!}{(x - 2)^{n+1}} - \frac{(-1)^n n!}{(x - 1)^{n+1}}. \end{aligned}$$

习题2-2(A) 11 设 $f(x) = 3x^3 + x^2|x|$, 求使得 $f^{(n)}(0)$ 存在的最高阶数 n .

解 函数 $3x^3$ 任意阶可导.

关于 $g(x) = x^2|x|$. 当 $x = 0$ 时, 有

$$\lim_{x \rightarrow 0^+} \frac{g(x) - g(0)}{x - 0} = \lim_{x \rightarrow 0^+} \frac{x^2|x| - 0}{x - 0} = \lim_{x \rightarrow 0^+} \frac{x^2 \cdot x - 0}{x - 0} = 0,$$

$$\lim_{x \rightarrow 0^-} \frac{g(x) - g(0)}{x - 0} = \lim_{x \rightarrow 0^-} \frac{x^2|x| - 0}{x - 0} = \lim_{x \rightarrow 0^-} \frac{-x^2 \cdot x - 0}{x - 0} = 0,$$

所以 $g'(0) = 0$.

当 $x > 0$ 时, 有

$$g'(x) = (x^2|x|)' = (x^2 \cdot x)' = 3x^2,$$

当 $x < 0$ 时, 有

$$g'(x) = (x^2|x|)' = (-x^2 \cdot x)' = -3x^2.$$

所以
$$g'(x) = \begin{cases} 3x^2, & x > 0, \\ 0, & x = 0, \\ -3x^2, & x < 0. \end{cases}$$

当 $x = 0$ 时, 有

$$\begin{aligned} \lim_{x \rightarrow 0^+} \frac{g'(x) - g'(0)}{x - 0} &= \lim_{x \rightarrow 0^+} \frac{3x^2 - 0}{x - 0} = 0, \\ \lim_{x \rightarrow 0^-} \frac{g'(x) - g'(0)}{x - 0} &= \lim_{x \rightarrow 0^-} \frac{-3x^2 - 0}{x - 0} = 0, \end{aligned}$$

所以 $g''(0) = 0$.

当 $x > 0$ 时, 有

$$g''(x) = (3x^2)' = 6x,$$

当 $x < 0$ 时, 有

$$g''(x) = (-3x^2)' = -6x.$$

所以 $g''(x) = \begin{cases} 6x, & x > 0, \\ 0, & x = 0, \\ -6x, & x < 0. \end{cases}$

当 $x = 0$ 时, 有

$$\lim_{x \rightarrow 0^+} \frac{g''(x) - g''(0)}{x - 0} = \lim_{x \rightarrow 0^+} \frac{6x - 0}{x - 0} = 6,$$
$$\lim_{x \rightarrow 0^-} \frac{g''(x) - g''(0)}{x - 0} = \lim_{x \rightarrow 0^-} \frac{-6x - 0}{x - 0} = -6,$$

所以 $g'''(0)$ 不存在.

所以, 使得 $f^{(n)}(0)$ 存在的最高阶数 $n = 2$.

习题2-2(A) 12 (1) 证明: 可导偶函数的导函数是奇函数.

证 如果 $f(x)$ 是偶函数, 则

$$\begin{aligned}f(-x) &= f(x), \\f(-x+h) &= f[-(x-h)] = f(x-h),\end{aligned}$$

所以

$$\begin{aligned}f'(-x) &= \lim_{h \rightarrow 0} \frac{f(-x+h) - f(-x)}{h} \\&= \lim_{h \rightarrow 0} \frac{f(x-h) - f(x)}{h} \\&= \lim_{h \rightarrow 0} -\frac{f(x-h) - f(x)}{-h} = -f'(x).\end{aligned}$$

习题2-2(A) 12 (2) 证明: 可导周期函数的导函数是周期函数.

证 如果 $f(x)$ 是周期函数, 设周期是 T , 则

$$f(x + T) = f(x),$$

所以

$$\begin{aligned} f'(x + T) &= \lim_{h \rightarrow 0} \frac{f(x + T + h) - f(x + T)}{h} \\ &= \lim_{h \rightarrow 0} \frac{f(x + h) - f(x)}{h} = f'(x). \end{aligned}$$

习题2-2(A) 13 设 $f(x)$ 二阶可导,

$$F(x) = \lim_{t \rightarrow \infty} t^2 \left[f\left(x + \frac{\pi}{t}\right) - f(x) \right] \sin \frac{x}{t}, \text{ 求 } F'(x).$$

证 因为

$$\begin{aligned} F(x) &= \lim_{t \rightarrow \infty} t^2 \left[f\left(x + \frac{\pi}{t}\right) - f(x) \right] \sin \frac{x}{t} \\ &= \lim_{t \rightarrow \infty} \left[\frac{f\left(x + \frac{\pi}{t}\right) - f(x)}{\frac{\pi}{t}} \cdot \frac{\sin \frac{x}{t}}{\frac{x}{t}} \cdot \pi x \right] \\ &= \pi x f'(x), \end{aligned}$$

所以

$$F'(x) = (\pi x f'(x))' = \pi[f'(x) + x f''(x)].$$

习题2-2(A) 14 求下列隐函数的导数.

(6) $y = 1 + xe^y$, 求 $\frac{d^2y}{dx^2}\bigg|_{x=0}$.

证 当 $x = 0$ 时, 代入方程, 得 $y = 1$.
方程 $y = 1 + xe^y$ 两边对 x 求导, 得

$$y' = (1 + xe^y)' = e^y + xe^y y', \quad (1)$$

带入 $x = 0, y(0) = 1$, 得

$$y'(0) = e^1 + 0 \cdot e^{y(0)} \cdot y'(0), \Rightarrow y'(0) = e.$$

方程(1)两边再对 x 求导, 得

$$\begin{aligned} y'' &= (e^y + xe^y y')' = (e^y)' + (xe^y y')' \\ &= e^y y' + e^y y' + x(e^y y')' = 2e^y y' + x(e^y y' y' + e^y y''), \end{aligned}$$

带入 $x = 0, y(0) = 1, y'(0) = e$, 得

$$y''(0) = 2e^2.$$
